Great quality at hyper speed app delivery: smart automation at low cost

Testing is a key activity from coding to deployment, but often costly and tedious. Re-use of any test with smart AI automation lowers repetitive manual efforts to a minimum: by capturing each test activity & replaying it anywhere. AI also minimizes business experts' tasks: reviewing & labeling unmatched changes only. Smart automation, low costs, relieved experts!

Learning the differences: Visual AI and Robust Replay[®]

Fast iterations in app delivery enable AI to identify and classify changes, anomalies and to involve experts when in doubt. With each iteration the pre-trained AI improves. And updates test steps automatically while replaying.

Human involvement: On-demand, focused & easy

Experts assess and label changes with screen-to-screen comparison where requested by the AI, developers receive full process- & debugging data. Sharing of test runs & results makes collaboration easy.

Image: Labeling of differences assisted by the AI Assistant

Key features

- Simple recording in Chrome
- Robust Replay[®] on any browser
- No-code test maintenance. Self-updating human readable scripts with each replay & labeling
- Expert involvement for review of differences instead of full re-testing
- Full screen visual comparison for easy labeling of unmatched changes
- Full fledged debugging data, easy to share and reproduce (replay) for developers
- Fully integrated in best-of-breed test management tool, IDE/developer workplace, defect tracking tool, CI/CD
- Cloud based or on-premise

Robust replay & self maintaining tests: key to productivity in testing

Key success factors for testing are separation of data from test scripts & testing at any stage of the development process. Key pains are varying environments & management of testing scopes, scripts through the life cycle of the app. With all data at hand, AI learns to identify UI targets, what's changing in the app, updating the UI scripts accordingly and re-assessing classification of changes in the UI. Based on developers & business experts' inputs with each run and the visual UI, DOM, network, console and other data processed by the AI Assistant.

Integrated in your tool chain: best-of-breed with smarts

Adding AI to your tool chain simplifies collaboration, ensures comprehensive data exchange and eases management efforts. LogicFlow integrates into the top global testing-, development- and defect tracking tools.

Reuse: simple migration of existing automation

Starting from scratch or with extensive test automation, the recording allows you to transfer testing activities to

the AI Assistant with no extra effort, whether from manual work or full-fledged test automation tool. Use the AI Assistant in cloud or on-premise.

Getting AI into your testing organization: quick & easy

Your business experts will love it: less time spent clicking, only time spent on validating business results. Your developers and testers will love it: no lengthy docs to write but precise results, easy to share. With your favored tools in place, adoption is quick. Lower costs and broader testing scopes result from less manual, tedious work. Get your team on board today! Start the AI journey!
